

# Option to use Good Data only in Analyses.

---

Originally posted on UserVoice

Analyses can suffer from bad calculations due to bad events for a tag, such as system digital state events returned for a numerical tag.

Although BadVal() can be implemented to avoid using bad events in these analyses, they add another layer of complexity the expression.

The addition of a "Use Good Data" only option in the analysis tab in PSE that applies BadVal handling on top of an analysis would help simplify expressions.
