

Keeping AF structure consistent with the Map layer

Originally posted on UserVoice

There is a new map feature created, while adding a new element based on the same element template in AF.

However, while deleting one of the existing AF elements does not delete the map feature.

Customer is monitoring oil wells. They are rebuilding the AF structure (using custom AF SDK script) once a day. They want to display only the active oil wells. The newly added oil wells are displayed alongside the updated ones and the removed ones (features) from the AF structure. They want to remove the map features for the non-existent elements (inactive wells).
