

Multiple instances for Asset Analytics

Originally posted on UserVoice

As a PI administrator I would like to be able to create multiple instances of "PI Analysis Service" windows service for these reasons:

- avoid new potentially problematic analysis from affecting the ones that are operational and working correctly by setting one production instance and one test instance for example.
- every instance could have its own log files and we could move some analyses to a new instance to troubleshoot them
- make possible to distribute the resources usage for asset analytics on more than one server
